The present invention describes hereditary haemochromatosis gene present from the human haemochromatosis gene. The present sequence products from the human haemochromatosis subregion from an hereditary haemochromatosis (HR) affected individual. Also described is a method to determine the presence or absence of the common hereditary haemochromatosis (HR) gene mutation in an individual comprising:

(a) providing DNA or RNA from the individual; and (b) assessing the bareonce or absence of the haplotype genotype indicates the likely presence of the BRE gene mutation in the genome of the individual. The BRE gene sequences from the present invention can be used to develop protein butyrophilin (BR), and can be used in the production of agonists of invention also describes BRF genes, which are homologues of the milk protein butyrophilin (BR), and can be used in the production of agonists and antagonists of Br function. Also described are: (1) a Roret gene which can be used to develop products for the study, diagnosis and treatment of lupus and Sjogren's syndrome; and (2) NPT3 and NPT4 genes which are homologues of a type I sodium transport gene, and can be used for hypophosphetemia.
                                               21-DEC-1998 (first entry)

Example 4: Page 440; 500pp; English.

The Expressed Sequence Tag was isolated from a human brain CDNA
The Expressed Sequence Tag was isolated from a human brain cDNA
Intrary as part of a large set of ESTS which can be used as markers
for human genes transcribed in vivo. They can be used to facilitate
tagging of most human genes, for mapping locations of expressed genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           disease, etc.
Claim 8; page 67-76; 160pp; English.
A human PLAZ-encoding CDNA (081139) expressing HPLAZ-10, was
isolated from human brain RNA by RACE-PCR. 2 Rat PLAZ CDNAS,
designated FNLAZ-8 (Q81136) and RPLAZ-10 (081137), ware isolated from
casignated RPLAZ-8 (Q81136) and RPLAZ-8, respectively. A partial human
genomic counterpart to RPLAZ-8, HPLAZ-8 (Q81139), was also obtained.
RPLAZ-8 and HPLAZ-8 have been designated type III PLAZ, and RPLAZ-10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            16-MAR-1994 (first entry)

Stein U, Walther W;

WPI: 94-168680/21.

The warm alian expression vector useful for gene therapy, comprising the promoter and/or the enhancer of the mdr-1 gene which is susceptible to cytostatic agents.

This is a preferred fragment of the mdr-1 gene promoter, isolated from human DNA. The mdr-1 promoter and enhancer elements are inducible by cytostatic agents such as vincristine and adriamycin which are used in cancer therapy. Vectors comprising the promoter and enhancer sequences operably linked to hetarclogous genes coding for therapeutic agents are claimed. Using the vectors, the therapeutic agents (e.g. anti-onocegenes, interferon, IL-2, IL-6, etc.) can be expressed in cancer cells under the control of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

Inducible by cytostatic agents on as vincristine and adriamycin which are used in cancer therapy. Vectors comprising the promoter and enhancer sequences operably linked to heterologous genes coding for therapeutic agents are claimed. Using the vectors, the herapeutic agents (e.g. anti-oncogenes, interferon, IL-2, IL-6, etc.) can be expressed in cancer cells under the control of cytostatic agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

DNA encoding human gastric inhibitory polypeptide precursor -
used as probe for diagnosis of diabetes and for producing
used as probe for diabetes treatment.

Disclosure; p; Bolish.

Disclosure was obtd. from a clone isolated from a cDNA library
C prepared from total RNA extracted from the duodenum of a patient
during panceato-duodenectomy for pancreatic cancer. The sequence
can be used to design probes (see features) for the diagnosis of
C diabetes. It may also be ligated into an expression vector for
prodn. of recombinant GIP. GIP accelerates the gastric secretion
and insulin secretion and can be used to treat diabetes.
C see also N82432 and N82433.

cell growth, particularly cancers
cell growth, particularly cancers
cell growth, particularly cancers
This sequence encodes the human heregular-like factor (HLF) of the invention. The HLF is involved in the regulation of cell growth.

Detection of different levels of expression of the HLF gene can be used for the diagnosis of disorders, e.g. in the neural system. In particular, detection of different levels of HLF gene expression in cells or body fluid of an individual can be used for diagnosing cancer. The products can also be used in the treatment of disorders involving abnormal levels of HLF activity.

Sequence 536 BP; 141 A; 131 C; 125 G; 120 T;
Example: Fig 2A-H: 98pp; English.

A CDNA molecule (T63334) codes for human nucleoprotein interactor

( (NFT-1) (W16327), a host cell protein which interacts with
influenza virus nucleoprotein (NP) and which may be an accessory
to find the protein influenza virus replication. It is the human
considered for influenza virus replication. It is the human
theractive trap selection using leaxa-NP as identified by
interactive trap selection using leaxa-NP as bait and yeast
transformed with a HeLa CDNA library, and by 5'RACE (see also
coned and analysed. The human NSII-1 gene (T63340), which codes
coned and analysed. The human NSII-1 gene (T63340), which codes
coned and analysed The human MSII-1 gene (T63340), which codes
coned and analysed and interacts with influenza virus protein
NSI was similarly identified. The CDNA clones can be used to
that inhibit viral replication.
Chat inhibit viral replication.

This is the MAGE-B cluster DNA sequence. The invention provides a novel method for screening for the possibility of a testicular seminoma, non-small cell lung carcinoma, breast cancer, sarcoma, or at least one nucleic acid molecule which hybridises to mRNA corresponding at least one nucleic acid molecule which hybridises to mRNA corresponding to an MAGE-XP gene, and determining hybridises to mRNA corresponding cossible presence of testicular seminoma, non-small cell lung carcinoma melanoma, breast cancer, sarcoma, or leukaemia in the sample. By assaying for the MAGE-B1 gene, both contained within this 4035 base pair MAGE-B cluster DNA sequence, the presence of such cancers in a sample can be determined. The genomic DNA that encodes the MAGE-B2 gene consists of nucleotides 3266-7979 of this MAGE-B1 gene, consists of in 5' to 3' order, nucleotides 31403-31474, 33958-34062, and 38088-39691, nucleotides 31403-31474, 33958-34062, and 38088-39691, nucleotides 3507-35139 and 38088-39691, and a kit to amplify a MAGE-B gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes hereditary haemochromatosis gene preducts from the human haemochromatosis gene. The present sequence products from the human haemochromatosis gene. The present sequence represents a hereditary haemochromatosis subregion from an individual maffected by hereditary haemochromatosis (HH). Also described is a method to determine the presence or absence of the common hereditary haemochromatosis (HF) gene mutation in an individual comprising:

(a) providing DNA or RNA from the individual; and (b) assessing the harmochromatosis (HF) gene mutation in an individual comprising:

(b) NA or RNA for the presence or absence of a haplotype or genotype where the presence or absence of the haplotype or genotype indicates the likely presence of the HFE gene mutation in the genome of the individual. The presence of the HFE gene mutation in the genome of the individual. The products for use in the diagnosis and treatment of HFE. The present invention also describes BTF genes, which are homologues of the milk and antagonists of BT function. Also described are: (1) a RoRet gene which can be used to develop products for the study, diagnosis and treatment of lupus and sjonghen's syndrome: and (2) NPT3 and NPT4 genes which are homologues of a type I sodium transport gene, and can can be used for hypophosphatemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Hereditary haemochromatosis subregion from an unaffected individual.

The present invention describes hereditary haemochromatosis gene products from the human haemochromatosis gene. The present sequence represents a hereditary haemochromatosis subregion from an hereditary haemochromatosis (HF) affected individual. Also described is a method to determine the presence or absence of the common hereditary haemochromatosis (HFE) gene mutation in an individual comprising:

(a) providing DNA or RNA from the individual; and (b) assessing the DNA or RNA for the presence of a haplotype or genotype indicates the likely presence of the HFE gene mutation in the genome of the individual. The HFE gene sequences from the present invention can be used to develop products for use in the diagnosis and treatment of HFE. The present invention also describes BTE genes, which are homologues of the milk protein butyrophilin (BT), and can be used in the production of agonists and antagonists of BTE function. Also described are: (1) a RoRet gene which can be used to develop products for the study, diagnosis and treatment of lugus and Sjogren's syndrome; and (2) NPT3 and NPT4 genes which are homologues of a type 1 sodium transport gene, and can
                                                                                                ö

This sequence encodes a novel human galactokinase. This protein and its encoding nucleic acid can be used in methods allowing the detection, diagnosis and treatment of human galactokinase deficiency.

New DNA methyltransferase nucleotide sequences - used particularly to develop antisense oligonucleotides for disgnostic and therapeutic purposes, particularly for inhibiting tumour growth claim 1; Page 38-40; 108pp; English.

"99091-128 represent DNA methyltransferase (DNA MeTase) genomic fragments. The sequences together sequentially produce the full length sequence v99128. The sequences can be used to derive antisense oligonucleotides which inhibit DNA MeTase expression. The antisense oligonucleotides can be used in investigating the role of DNA MeTase in cellular growth. They can be administered at different points in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1895 AACCICIGCCICCCGGGTICAAGIGATICTCCCIGCCI 1931

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Clone reference: Ming-Hui Wei et al, 56,1487-1492,1996.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence was finished as follows unless otherwise noted: all regions were double stranded or sequenced with an alternate chemistry; an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        NOTICE: This sequence may not be the entire insert of this clone. It may be shorter because we only sequence overlapping sections once, or longer because we provide a small overlap between neighboring submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo.

Sequencing vector: pUCl8: L08752
Chemistry: Big Dye terminators
Assembly program: Phrap; version 0.990399.
* NOTE: This record contains 192 individual
* sequencing reads that have not been assembled into
* contigs. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
* identifying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced.
* However, it should not be assumed that this clone
* will be sequenced to completion. In the event that
* the record is updated, the accession number will
* be preserved.

tonsists of 32 contigs. The true order of the pieces

to not known and their order in this sequence record is

a true known and their order in this sequence record is

true of N, but the exact sizes of the gaps are unknown.

This record will be updated with the finished sequence

as soon as it is available and the accession number will

be preserved.

**NOTE: This record contains 186 individual

**NOTE: This record contains 186 individual

**Sequencing reads that have not been assembled into

**contains Runs of N are used to separate the reads

**and the order in which they appear is completely

**arbitrary. Low-pass sequence sampling is useful for

**identifying clones that may be gene-rich and allows

**overlap relationships among clones to be deduced.

**However, it should not be assumed that this clone

**will be sequenced to completion. In the event that

** the record is updated, the accession number will

** be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ;

Submitted (19-OCT-1999) Genome Sequencing Center, Washington University School of Medicine, 4444 Forest Park Parkway, St. Loui University School of Medicine, 4444 Forest Park Parkway, St. Loui MO 63108, USA

* NOTE: This is a 'working draft' sequence. It currently consists of 4 contigs. The true order of the pieces

* is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as "runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   NOTICE: This 'working draft' quality sequence may consist of several contigs from automated sequence assembly concatenated together. No attempt has been made to order or orient the contigs relative to one another correctly before concatenating. At each location in the sequence where contigs have been joined, several consecutive Ns may have been inserted.
                                                                                                                        Eukaryota: Metazoa; Chordata; Craniata; Vertebrata; Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo.

                                                                                                                                                                                                       NOTE: This is a 'working draft' sequence. It currently consists of 17 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

It currently consists of 15 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
